Mitigating Bias

The task for this activity is to decide where the biases should be placed on the project lifecycle model.

There isn't a single right answer here because many of the biases could impact a variety of processes across several stages of the project lifecycle. Furthermore, the effects of a bias can cascade through downstream stages.

Therefore, it is fine to place a bias in the stage where you think it is likely to have the most significant impact.

When mapping the biases to specific stages, think about the following questions:

- Who are the stakeholders involved in this project? Which activities/stages are they most likely to interact with?
- What data would need to be collected in order for this project to be successful?
- How will the accuracy of the system be tested during development?
- How will the use of this system be perceived by different groups?

You can access the bias cards here:
